provided $\text{Re}(s) > a+2$.

We have

$$F(s) = e^5 G(s) \quad (0.0.4)$$

$$= e^5 \left(\frac{1}{s - (a + 2)} \right) \quad (0.0.5)$$

provided $\text{Re}(s) > a+2$.

\therefore Laplace transform of $e^{(a+2)t+5}$ exists for $\text{Re}(s) > a+2$.

Hence option (d) is correct.

QUESTION

GATE EC-2005 Question 31

In what range should $\text{Re}(s)$ remain so that the Laplace transform of the function $e^{(a+2)t+5}$ exists?

- (a) $\text{Re}(s) > a+2$
- (b) $\text{Re}(s) > a+7$
- (c) $\text{Re}(s) < 2$
- (d) $\text{Re}(s) > a+5$

SOLUTION

Lemma 0.1 (Laplace transform formula).

<i>Time Function</i> $f(t) = \mathcal{L}^{-1}\{F(s)\}$	<i>Laplace transform of $f(t)$</i> $F(s) = \mathcal{L}\{f(t)\}$	<i>ROC</i>
$e^{\alpha t}$	$\frac{1}{s-\alpha}$	$\text{Re}(s) > \alpha$

Given function is given by

$$f(t) = e^{(a+2)t+5} \quad (0.0.1)$$

$$= e^5 e^{(a+2)t} \quad (0.0.2)$$

Let $g(t) = e^{(a+2)t}$ which is in the form of $e^{\alpha t}$ where $\alpha = a + 2$.

Let the Laplace transform of $f(t)$ and $g(t)$ be $F(s)$ and $G(s)$ respectively.

From Lemma 0.1 we have,

$$G(s) = \frac{1}{s - (a + 2)} \quad (0.0.3)$$
